

Design choices

- Chose data that seemed interesting (Quality of Life for Europe)
- Thought the most logical chart-type to depict ranking with would be a bar-chart.
- Decided that the variables of which a variable consists of should be represented in %'s, and this could best be depicted in a pie-chart.
- Pie-chart seemed rather boring, made a donut-chart out of it, legend in the middle.
- Decided to add categorical colouring to the donut-chart to spice it up.
- Decided green/purple colours didn't match on the bar chart, chose for a softer green with a harsher green to make the selected bar strike out more.
- Used same green colours for the tooltips of both charts to keep it regular.
- Chose to add ranking number and country to the bottom-right of the donut-chart, making it more evident and memorable which country is currently selected.
- Added numerical labels on the outer edges of the arc's (pieces of the donut-chart), looks fancy and now you don't necessarily have to hover over to check the value.
- Decided the bar chart didn't need this, as the visual aspect shows which countries have a higher/lower rating, and that's all that's needed really.
